Description

The SFY Functional Safety SIL 3 capable Frequency-to-DC Transmitter with Display is part of Moore Industries' **FS Functional Safety Series**. It monitors frequency, period, high or low pulse width, and contact closure signals and converts the input signal to a proportional, input-to-output isolated 4-20mA output ready for direct interface with a Safety System, readout instrument, recorder, PLC, DCS, SCADA system.

The 2-wire (loop-powered) SFY is ideal for use in your Safety Instrumented System (SIS) in a wide range of process and factory automation monitoring applications:

- Turbine Tachometer Generators
 - Turbine Flow Meters
- Magnetic Pickups • Dry Contact Closures
- Variable Frequency Drives • Rotating Equipment
 - Pulse and Frequency Output Transducers
 - Motor and Conveyor Speed

Figure 1. The SFY configures with application-specific operating parameters in just minutes using our single-window Intelligent PC Configuration Software

The SFY installs quickly and easily in harsh conditions using our protective field-mount enclosures, or on a surface, DIN-rail or relay track.

Features

- **exida certified to IEC 61508:2010.** Certified by exida to IEC 61508 for systematic integrity up to SIL 3 and for random integrity up to SIL 2. This means that an SFY is approved for single use in Safety Instrumented Systems (SIS) up to SIL 2 and in a redundant architecture (1oo2, 2oo3, etc.) up to SIL 3.
- **Comprehensive FMEDA certified safety data.** Upon request, exida-certified FMEDA data is available for a functional safety practitioner to use in determining the SFY's applicability in specific safety-related applications.
- **Exceptional accuracy and long-term stability.** Typical accuracy is $\pm 0.025\%$ of span with up to 5 years between scheduled calibrations.
- **Sets up in minutes with PC software.** You can choose, and then view to confirm, all application-specific operating parameters.
- **Versatile input choices.** Measures frequency ranges between an amazingly low 0.005Hz up to 25kHz; periods from 40microseconds to 200sec; and pulse widths from 0.2msec to 200 seconds.
- **Programmable moving average filter.** Minimizes measurement instability caused by the effects of bent turbine blades and other frequency variations.
- **User-configurable display.** A 5-digit LCD shows the process variable in selectable engineering units.
- **Input-to-output isolated and RFI/EMI protected.** Resistant to unpredictable ground loops and the harmful effects of plant and equipment "noise".

Frequency Monitoring in Safety Systems

The SFY can be used in Safety Instrument Functions (SIF) where frequency or pulse signals need to be monitored. Examples of these include turbine over speed protection, critical exhaust fans for personnel safety, compressor monitoring and protection.

FMEDA reports are available with the required safety data to ensure that the SFY meets the requirements of each SIF.

Turbine Over Speed Protection

In the example below the SFY is used as part of an SIF to shut down a turbine if it exceeds a defined speed.

Figure 2. Turbine Over Speed Protection System

Figure 3. Compressor Monitoring and Protection

Compressor Monitoring and Protection

Critical compressors often need an independent safety protection system. The SFY can be used as part of the SIF to monitor the speed and provide data to a safety logic solver.

To accomplish this, a magnetic pickup is attached to the compressor shaft (Figure 3). The pickup provides a frequency output. The SFY takes the pickup signal, converts it to a 4-20mA output proportional to the compressor shaft speed, and transmits it to the SIS Logic Solver. Should there be an unwanted change in speed, it can be detected at the Logic Solver.
